TITLE: Acute Oral Toxicity Study of CP4 EPSPS Protein in Albino Mice

AUTHORS: M. W. Naylor, B.S.

ABSTRACT: CP4 EPSPS protein (CP4) was administered as a single dose by gavage to groups of ten CD-1 mice/sex at dosages of 49, 154 and 572 mg/kg (target doses were 40, 100 and 400 mg/kg). A vehicle control group of 10 mice/sex was administered the vehicle, 50mM Na bicarbonate buffer solution, at a dosage of 33.33 ml/kg. Another control group (also termed vehicle control in the computer tables) of 10 mice/sex was administered bovine serum albumin (BSA) at a dosage of 363 mg/kg (also at 33.33 ml/kg; target dosage was 400 mg/kg). Clinical observations were performed, and body weights and food consumption were determined. All surviving animals were necropsied at study termination (Days 8-9). Numerous tissues were retained, but no tissues were examined microscopically.

There were no treatment-related effects on body weight, food consumption, survival, clinical observations or gross pathology.

There were no adverse effects by CP4 protein at dosages up to 572 mg/kg, administered by gavage to mice. Therefore, the highest dosage (572 mg/kg) of CP4 protein administered by gavage to mice was considered a No-Effect-Level (NOEL).

SUMMARY

CP4 EPSPS protein (CP4) was administered as a single dose by gavage to groups of ten CD-1 mice/sex at dosages of 49, 154 and 572 mg/kg (target doses were 40, 100 and 400 mg/kg). A vehicle control group of 10 mice/sex was administered the vehicle, 50mM Na bicarbonate buffer solution, at a dosage of 33.33 ml/kg. Another control group (also termed vehicle control in the computer tables) of 10 mice/sex was administered bovine serum albumin (BSA) at a dosage of 363 mg/kg (also at 33.33 ml/kg; target dosage was 400 mg/kg). Clinical observations were performed, and body weights and food consumption were determined. All surviving animals were necropsied at study termination (Days 8-9). Numerous tissues were retained, but no tissues were examined microscopically.

There were no treatment-related effects on body weight, food consumption, survival, clinical observations or gross pathology.

There were no adverse effects by CP4 protein at dosages up to 572 mg/kg, administered by gavage to mice. Therefore, the highest dosage (572 mg/kg) of CP4 protein administered by gavage to mice was considered a No-Effect-Level (NOEL).

TERMS

The following terms are used as column headings in some data tables:

GEN	Generation (F0, F1, etc.) used in reproduction studies.
PERIOD (PER)	A number corresponding to a specified interval within the study; used to facilitate data reporting.
WINDOW	A series of days within a study when data could have been collected for the corresponding period. Actual data collection occurred on one or more of the days within the window.

ANIMAL IDENTIFICATION SYSTEM

The current EHL animal number format is YYXXXSGAANN where YYXXX is the study number, Y is the study year, and X is the sequence number within the year. The S represents the animal's sex, G is the primary group code, A's may represent the subgroup code (in most cases these characters are blank), and N is the animal's sequence number within the group (or subgroup), e.g., 99999M2 001. The animal designation may be further reduced by exclusion of the study number and blank subgroup codes, e.g., M2001. These abbreviated animal identifications will include five to seven characters, depending on the number of characters in the subgroup code.

Statistics

The following procedures were used to detect statistically significant differences between treated animals and their respective controls:

Dunnett's Multiple Comparison Test (two-tailed) (1): Inlife body weights, cumulative weight gain and food consumption

Terminal body weights were evaluated by decision-tree statistical analysis procedures which, depending on the results of tests for normality (2) and homogeneity of variances (Bartlett's Test), utilized either parametric (Dunnett's Test and Linear Regression) or nonparametric (Kruskal-Wallis, Jonckheere's and/or Mann-Whitney Tests) routines to detect group differences and analyze for trend.

Other statistical routines used for some data were: Bartlett's Test (3) to evaluate homogeneity of variances, Analysis of Variance (4) to determine if the sample (group) means could be considered as an estimate of a common population.

RESULTS

Inlife

Mortality

Refer to Appendix 1, Table 4; Appendix 2, Table 4. All animals survived to the scheduled termination of the study.

Body Weight

Refer to Appendix 1, Tables 1 and 2; Appendix 2, Table 1. There were no statistically significant differences in group mean body weight or cumulative weight gain in any of the groups treated with either BSA or the CP4 protein, when compared to the carbonate buffer vehicle control group.

Food Consumption

Refer to Appendix 1, Table 3; Appendix 2, Table 2. There were no statistically significant differences in group mean food consumption by any of the groups treated with either BSA or the CP4 protein, when compared to the carbonate buffer vehicle control group.

Clinical Signs

Refer to Appendix 1, Table 4; Appendix 2, Table 3. There were no abnormal clinical signs.

Pathology

Gross Pathology

Refer to Appendix 1, Tables 5-6; Appendix 3, Table 1. There were no statistically significant differences in group mean terminal body weights, and there were no gross lesions considered related to treatment.

DISCUSSION

There were no adverse findings considered related to treatment in any of the groups. Therefore, the highest dosage (572 mg/kg) of CP4 protein administered by gavage to mice was considered a No-Observed-Effect-Level (NOEL).
