[138-20]

Call for submissions – Application A1207

Rebaudioside M as a Steviol Glycoside from Saccharomyces cerevisiae

Food Standards Australia New Zealand (FSANZ) has assessed an application made by Amyris Inc. to permit the use of the steviol glycoside, rebaudioside M, that is produced by fermentation from a genetically modified *Saccharomyces cerevisiae*, expressing steviol glycoside biosynthesis pathway genes, as a general purpose sweetening agent and has prepared a draft food regulatory measure. Pursuant to section 31 of the *Food Standards Australia New Zealand Act 1991* (FSANZ Act), FSANZ now calls for submissions to assist consideration of the draft food regulatory measure.

For information about making a submission, visit the FSANZ website at information for submitters.

All submissions on applications and proposals will be published on our website. We will not publish material that we accept as confidential, but will record that such information is held. In-confidence submissions may be subject to release under the provisions of the *Freedom of Information Act 1991*. Submissions will be published as soon as possible after the end of the public comment period. Where large numbers of documents are involved, FSANZ will make these available on CD, rather than on the website.

Under section 114 of the FSANZ Act, some information provided to FSANZ cannot be disclosed. More information about the disclosure of confidential commercial information is available on the FSANZ website at <u>information for submitters</u>.

Submissions should be made in writing; be marked clearly with the word 'Submission' and quote the correct project number and name. While FSANZ accepts submissions in hard copy to our offices, it is more convenient to receive submissions electronically through the FSANZ website via the link on documents for public comment. You can also email your submission directly to submissions@foodstandards.gov.au.

There is no need to send a hard copy of your submission if you have submitted it by email or via the FSANZ website. FSANZ endeavours to formally acknowledge receipt of submissions within 3 business days.

DEADLINE FOR SUBMISSIONS: 6pm (Canberra time) 2 December 2020

Submissions received after this date will not be considered unless an extension had been given before the closing date. Extensions will only be granted due to extraordinary circumstances during the submission period. Any agreed extension will be notified on the FSANZ website and will apply to all submitters. Questions about making submissions or the application process can be sent to standards.management@foodstandards.gov.au.

Hard copy submissions may be sent to one of the following addresses:

Food Standards Australia New Zealand PO Box 5423 KINGSTON ACT 2604 AUSTRALIA Tel +61 2 6271 2222 Food Standards Australia New Zealand PO Box 10559 The Terrace WELLINGTON 6143 NEW ZEALAND Tel +64 4 978 5630

The <u>following document</u>¹ which informed the assessment of this application is available on the FSANZ website:

SD1 Risk and technical assessment report

¹ https://www.foodstandards.gov.au/code/applications/Pages/A1207.aspx

Executive summary

Amyris Inc. (Amyris) has applied for a variation to the Australia New Zealand Food Standards Code (the Code) that will permit the use of rebaudioside M (Reb M) produced from fermentation by a genetically modified (GM) Saccharomyces cerevisiae (S. cerevisiae) strain, as a food additive general purpose sweetening agent (intense sweetener).

Food Standards Australia New Zealand (FSANZ) has assessed the application in accordance with the *Food Standards Australia New Zealand Act 1991* (FSANZ Act) and prepared a draft variation to the Code to permit Amyris's Reb M as a food additive. FSANZ now seeks public submissions on the assessment and the draft variation.

Reb M is a steviol glycoside, being one of various steviol glycosides already permitted as food additives in the Code but there is no permission for Amyris's Reb M. Amyris uses the microbial fermentation production method for its Reb M, produced from *S. cerevisiae* expressing steviol glycoside biosynthesis pathway genes. This method is comparable to the recently permitted rebaudioside MD from application A1170 (see section S3—39 in the Code).

Steviol glycosides, including Reb M, are already permitted for use as a food additive in the Code, with maximum permitted levels (MPL) in a variety of food categories and at GMP levels in tabletop sweeteners in Schedule 15. No changes to the current steviol glycosides permissions were requested.

An acceptable daily intake (ADI) of 0-4 mg/kg bodyweight for steviol glycosides, expressed as steviol, was established by FSANZ in 2008. This ADI is appropriate for Reb M produced from fermentation, as it is chemically the same as Reb M extracted traditionally from the leaves of *Stevia rebaudiana* Bertoni and would therefore follow the same metabolic pathway in humans. No new information was located subsequent to FSANZ's previous assessments of steviol glycosides that would raise concerns regarding the safety of steviol glycosides.

Amyris's Reb M meets the purity parameters of specifications in section S3—39 of the Code but not the specific method of production. These parameters are also consistent with international purity specifications for steviol glycosides. Its proposed technological purpose as an intense sweetener food additive matches that of permitted steviol glycoside preparations produced by the currently permitted methods.

Assessment of the host *S. cerevisiae* strain confirms that the *S. cerevisiae* strain is neither pathogenic nor toxigenic and has a long history of food use. Analysis of the production strain confirmed the presence and stability of the inserted DNA. The final product does not contain residual protein or DNA and does not give rise to any allergen concerns.

FSANZ has assessed that Amyris's Reb M produced from *S. cerevisiae* expressing steviol glycoside biosynthesis pathway genes does not pose a risk to public health and safety.

1 Introduction

1.1 The applicant

The applicant, Amyris Inc. (Amyris), is a manufacturer of food ingredients and provides food and non-food applications worldwide.

1.2 The application

Amyris's application, accepted on 23 July 2020, seeks to change the Australia New Zealand Food Standards Code (the Code) to permit a purified steviol glycoside preparation for use as an intense sweetener that is produced by *Saccharomyces cerevisiae* (*S. cerevisiae*) expressing steviol glycoside biosynthesis pathway genes. This purified steviol glycoside product, is primarily comprised of rebaudioside M (Reb M) and may contain a minor amount of other steviol glycosides. Steviol glycosides are food additives used as intense sweeteners and are permitted for addition to a variety of foods within the Code. The current permissions for steviol glycosides in the Code allow for products extracted from the *Stevia rebaudiana* Bertoni plant either by hot water extraction or by bioconversion of the plant extract, as well as via fermentation process (like the production method for this application). Amyris uses a microbial fermentation method with a genetically modified yeast (*S. cerevisiae*) to manufacture Reb M. The steviol glycosides (Reb M and minor other steviol glycosides) are identical to those produced from the plant.

Amyris seeks an amendment to Schedule 3 of the Code to allow for Amyris's Reb M.

1.3 The current Code requirements

Australian and New Zealand food laws require food for sale to comply with the following requirements of the Code.

Paragraph 1.1.1—10(6)(a) provides that, unless expressly permitted by the Code, a food for sale cannot contain, as an ingredient or component, a substance that is used as a food additive. The Code also imposes identity and purity specifications with which Reb M and other steviol glycosides must comply.

The Code currently permits the use of steviol glycosides as food additives with the INS number 960. They are permitted in a wide range of food categories listed within the table to section S15—5 at maximum permitted levels (MPL) and at Good Manufacturing Practice (GMP) for tabletop sweeteners only.

However, the current specifications for identity and purity do not allow for Amyris's production method.

1.3.1 Food additives

Section 1.1.2—11 defines the expression 'used as a food additive'. Subsection 1.1.2—11(1) provides that a substance is 'used as a food additive' in relation to a food if both of the following conditions are met: the substance is added to the food to perform one or more technological functions listed in Schedule 14; and the substance is identified in subsection 1.1.2—11(2) – this includes (among other things) a substance identified in the table to section S15—5 as a permitted food additive.

Section 1.3.1—3 details when substances are permitted to be used as food additives in food.

Schedule 14 lists the permitted technological purposes of food additives. The table in section S14—2 provides that use as an intense sweetener is a permitted purpose.

Schedule 15 lists the specific food additive permissions for different categories of foods in the table to section S15—5. 'Steviol glycosides' is listed in that table as a permitted food additive for various food categories.

Schedule 16 sets out the types of substances that may be used as food additives in any food at GMP levels. As 'steviol glycosides' is not such a food additive, it is not listed in Schedule 16.

Section 1.5.2—3 provides that permission for use as a food additive also constitutes the permission required by paragraph 1.1.1—10(6) for a food produced using gene technology.

1.3.2 Labelling

Paragraph 1.1.1—10(8) of the Code provides that food for sale must comply with all relevant labelling requirements imposed by the Code for that food.

The Code's labelling requirements which apply to foods for retail sale and to foods sold to a caterer are set out in Divisions 2 and 3 of Standard 1.2.1 respectively.

The Code requires the labels of most packaged food to contain a statement of ingredients. Subsection 1.2.4—7(1) requires food additives to be declared in the statement of ingredients by one of the following methods: if the food additive can be classified in accordance with Schedule 7—the relevant class name followed in brackets by the name or code number of the food additive specified in Schedule 8; or else, the name of the food additive specified in Schedule 8.

Schedule 7 lists the food additive class names that can be used in the statement of ingredients. Schedule 8 lists the names and code numbers of food additives that are to be used for labelling purposes.

Section 1.5.2—4 of Standard 1.5.2 outlines requirements for labelling of certain foods for sale that consist of, or have as an ingredient, food that is a genetically modified food. For labelling purposes, *genetically modified food* is defined in subsection 1.5.2—4(5) as a *food produced using gene technology* that contains novel DNA or novel protein or is listed in section \$26—3.

1.3.3 Identity and purity requirements

Paragraph 1.1.1—15(1)(a) of the Code requires substances used as food additives to comply with any relevant identity and purity specifications listed in Schedule 3 of the Code.

Sections S3—31 and S3—32 of Schedule 3 provide specifications for rebaudioside M and for steviol glycoside mixtures containing rebaudioside M. These refer to primary source specifications for steviol glycosides contained within section S3—2, being either S3—2(1)(b) [the FAO² JECFA³ Monograph, (JECFA 2017)], S3-2(1)(c) [the Food Chemicals Codex (FCC 2018)] or S3—2(1)(d) [European Commission Regulation No 231/2012 laying down specifications for food additives (EC 2012, EC 2016)]. Specifications for steviol glycosides from these primary sources, including rebaudioside M, include a production method of extraction from the leaves of stevia (*S. rebaudiana* Bertoni).

Of most relevance to this application Schedule 3 also contains section S3—39 which

³ The Joint FAO/World Health Organization (WHO) Expert Committee on Food Additives

² The Food and Agriculture Organization of the United Nations

provides a specification for steviol glycosides produced via a fermentation process using microorganisms. This method of production is permitted to produce Reb MD, using a genetically modified *S. cerevisiae*, but it is a different strain to Amyris's yeast.

Section S3—35 of Schedule 3 also provides a specification for steviol glycosides prepared from the leaves of stevia (*S. rebaudiana* Bertoni) and a novel multi-step enzymatic pathway process. This method of production of steviol glycosides is different to the fermentation method of this application.

1.3.4 International Standards

Steviol glycosides are approved for use in a number of other jurisdictions, including the European Union, Canada, South and North Asia, Asia Pacific, United States of America (USA), Central/South America, the Middle East and Africa (PureCircle Stevia Institute, 2020). In the European Union, commercially available steviol glycoside products must comply with the specifications for steviol glycosides (INS number 960) adopted by the European Commission in 2012 and updated in 2016 (EC 2012, EC 2016).

1.3.4.1 JECFA

The 87th JECFA meeting in June 2019 established a framework for steviol glycosides building on JECFA's assessments and specifications at earlier meetings. The 87th meeting also prepared four steviol glycosides specification annexes, for the different production methods (JECFA 2020). These are:

- hot water extraction from the leaves of Stevia rebaudiana Bertoni (stevia) plant (Annex
 1)
- fermentation using GM microorganisms (Annex 2)
- enzymatic modification (bioconversion) of the stevia plant extract using enzymes (Annex 3)
- glycosylation of stevia plant extracts using enzymes to add glucose units to steviol glycosides (Annex 4, tentative pending further information to finalise).

This meeting also confirmed that steviol glycosides prepared using any of these production methods, that comply with the specifications for the different production methods and purity requirements were considered equivalent in terms of safety and the earlier determined Acceptable Daily Intake (ADI) applies (JECFA 2019a, JECFA 2019b).

It is important to note that the steviol glycosides specifications from the 87th JECFA meeting in 2019 have not yet been discussed by the Codex Committee on Food Additives (CCFA) or ultimately ratified by the Codex Alimentarius Committee (CAC) due to the cancelling of the CCFA 2020 meeting caused by the COVID-19 pandemic. Therefore these specifications are not yet part of the official JECFA Combined Compendium of Food Additive Specifications. The most current JECFA steviol glycosides monograph is monograph 20 from the 84th JECFA meeting in 2017.

Some earlier relevant JECFA meetings are the 84th meeting in 2017, where the Committee published JECFA Monograph 20 (JECFA 2017), superseding tentative specifications prepared at the 82nd JECFA meeting (2016) and published in FAO JECFA Monograph 19. An ADI of 0 - 4 mg/kg bodyweight (bw) (expressed as steviol) was established at the 69th JECFA meeting (2008).

1.3.4.2 USA

Reb M has GRAS (Generally Recognized as Safe) status for a variety of food and beverage uses, and for different steviol glycosides producers in the USA. The US Food and Drug

Administration (FDA) reviewed the self-assessed GRAS notification (GRN 812) describing the production of Amyris's Reb M produced in *S. cerevisiae* and responded on December 8, 2018 with a "no questions" letter regarding the GRAS status of Reb M. The FDA does not make its own assessment of such GRAS notifications.

1.4 Reasons for accepting application

The Application was accepted for assessment because:

- it complied with the procedural requirements under subsection 22(2) of the FSANZ Act
- it related to a matter that warranted the variation of a food regulatory measure.

1.5 Procedure for assessment

The application is being assessed under the General Procedure.

2 Summary of the assessment

2.1 Risk assessment

FSANZ has assessed the public health and safety risks associated with Amyris's Reb M as a food additive (see SD1). The summary of this risk assessment is provided below.

The food technology assessment concludes that Amyris's Reb M produced from Amyris's production strain of *S. cerevisiae* expressing steviol glycoside biosynthesis pathway genes meets the purity parameters of specifications in section S3—39 which sets out the specifications for steviol glycosides produced by fermentation but not the specific method of production. The purity parameters for Amyris's Reb M are also consistent with international purity specifications for steviol glycosides. Its technological purpose matches that of permitted steviol glycosides preparations produced by the currently permitted methods and meets the proposed purpose as an intense sweetener food additive.

FSANZ has assessed that the host *S. cerevisiae* strain is neither pathogenic nor toxigenic and has a long history of food use. Analysis of the production strain confirmed the presence and stability of the inserted DNA. The final product does not contain residual protein or DNA and does not give rise to any allergen concerns.

An ADI of 0-4 mg/kg bw for steviol glycosides, expressed as steviol, was established by FSANZ in 2008. This ADI is appropriate for Reb M produced from fermentation, as it is chemically the same as Reb M extracted traditionally from the leaves of *S. rebaudiana* Bertoni and would therefore follow the same metabolic pathway in humans. No new information has been identified subsequent to FSANZ's previous assessments that would raise concerns regarding the safety of steviol glycosides.

FSANZ has assessed that no potential public health and safety concerns have been identified with Amyris's Reb M produced from *S. cerevisiae* expressing steviol glycoside biosynthesis pathway genes.

2.2 Risk management

This application is very similar to an earlier application FSANZ assessed and approved, being A1170 (FSANZ 2019a), since both applicants produce their steviol glycosides preparation via fermentation using a genetically modified *S. cerevisiae*. Therefore the risk management considerations are also very similar.

The risk management options available to FSANZ, after assessment, were to either reject the application or to prepare a draft variation to amend the Code to permit Amyris's Reb M.

FSANZ risk assessment concluded that Amyris's Reb M produced via its fermentation method of production using a genetically modified *S. cerevisiae* containing the genes for the production of rebaudiosides is safe and suitable for the proposed purpose of an intense sweetener. FSANZ considers that it is therefore appropriate to prepare a draft variation to amend the Code to permit Amyris's Reb M as a steviol glycosides preparation (as a food additive) at current levels and in those food classes which currently permit steviol glycosides.

FSANZ considers the Reb M is a food additive produced using gene technology i.e. 'derived or developed from an organism that has been modified using gene technology'. Paragraph 1.1.1—10(6)(g) requires that the presence as an ingredient or component in a food for sale of a food produced using gene technology must be expressly permitted by the Code. Section 1.5.2—3 provides that permission for use as a food additive also constitutes the permission required by paragraph 1.1.1—10(6)(g) (as noted in section 1.3.1).

Other risk management considerations relate to labelling requirements which are summarised in the sections below.

2.2.1 Labelling

2.2.1.1 Ingredient labelling

Under existing labelling requirements in the Code (unless the food is exempt from the requirement for a statement of ingredients) the Reb M preparation will require declaration as a food additive in the statement of ingredients on the label of foods. These ingredient labelling requirements require steviol glycosides to be identified in the statement of ingredients using the food additive name 'steviol glycosides' or the International Numbering System (INS) code number 960 (as listed in Schedule 8).

As noted in previous reports (for applications A1170, A1172, A1176 and A1183) (FSANZ 2019a, FSANZ 2019b, FSANZ 2019c, FSANZ 2020), the Codex Committee on Food Additives (CCFA) has updated the INS numbers for steviol glycosides. These were subsequently adopted into the Class Names and International Numbering System for Food Additives (CXG 36-1989) by the Codex Alimentarius Commission (Codex 2019b). The new numbers distinguish between steviol glycosides produced from the plant (Steviol glycosides from Stevia rebaudiana Bertoni – INS 960a) and those produced by fermentation (INS 960b). Numbers have not been assigned however, for other methods of production such as enzymatic conversion. For various reasons, in particular because the INS listing has not been finalised for steviol glycosides produced by different methods of production, FSANZ decided not to include 960a and 960b in the Code when assessing earlier applications (A1170 (FSANZ 2019a) and A1183 (FSANZ 2020)). FSANZ still considers that at this stage the most appropriate INS number for labelling purposes, for all steviol glycosides, is 960. FSANZ will consider changes to this number in the Code in the future, but only if and when further finalised changes are made to the Codex INS list. This would provide a more coordinated approach and efficient transition compared to an unsystematic or ad-hoc approach through various applications.

The FSANZ website has been updated to provide information on the new production methods for steviol glycosides⁴. Consumers wanting to know the source of any particular steviol glycosides in foods are advised that they may ask the manufacturer who should advise them accordingly.

⁴ For more information please see the following FSANZ webpage: https://www.foodstandards.gov.au/consumer/additives/Pages/Steviol-glycosides-(960)-(intense-sweetener).aspx

2.2.1.2 Labelling as 'genetically modified'

As noted in section 2.2, the Reb M preparation is a *food produced using gene technology*. Standard 1.5.2 generally requires food produced using gene technology to be labelled as 'genetically modified' if it contains novel DNA or novel protein. As discussed in sections 2.5 and 3.1.5 of SD1, it is highly unlikely that novel protein or DNA will be present in the Reb M preparation. However, if Reb M is used as an ingredient in a food for retail sale or a food sold to a caterer and novel DNA or protein is present, the requirement to label Reb M as 'genetically modified' would apply in accordance with section 1.5.2—4 of the Code.

2.2.2 Risk management conclusion

FSANZ's risk management proposal is to permit the use of Amyris's Reb M produced by a GM yeast strain as a food additive. FSANZ's decision was based on the risk assessment, risk management and the FSANZ Act considerations, including the cost benefit considerations (detailed in section 2.4.1.1).

2.3 Risk communication

2.3.1 Consultation

Consultation is a key part of FSANZ's standards development process. FSANZ developed and applied a basic communication strategy to this application. All calls for submissions are notified via the Food Standards Notification Circular, media release, FSANZ's social media tools and Food Standards News.

The process by which FSANZ considers standard development matters is open, accountable, consultative and transparent. Public submissions are called to obtain the views of interested parties on issues raised by the application and the impacts of regulatory options. FSANZ acknowledges the time taken by individuals and organisations to make submissions on this application.

The draft variation will be considered for approval by the FSANZ Board taking into account public comments received from this call for submissions.

2.3.2 World Trade Organization (WTO)

As members of the World Trade Organization (WTO), Australia and New Zealand are obliged to notify WTO members where proposed mandatory regulatory measures are inconsistent with any existing or imminent international standards and the proposed measure may have a significant effect on trade.

There are relevant international standards for Reb M. Amending the Code to permit Reb M produced from fermentation is unlikely to have a significant effect on international trade as the specification is identical to currently permitted rebaudiosides M, which are produced using the traditional hot water extraction method, or bioconversion using enzymes from the plant extract. Therefore, a notification to the WTO under Australia's and New Zealand's obligations under the WTO Technical Barriers to Trade or application of Sanitary and Phytosanitary Measures Agreement was not considered necessary.

2.4 FSANZ Act assessment requirements

When assessing this application and the subsequent development of a food regulatory measure, FSANZ has had regard to the following matters in section 29 of the FSANZ Act:

2.4.1 Section 29

2.4.1.1 Consideration of costs and benefits

The Office of Best Practice Regulation (OBPR) granted FSANZ a standing exemption from the requirement to develop a Regulatory Impact Statement for the approval of additional food additives (OBPR correspondence dated 24 November 2010, reference 12065). This standing exemption was provided as permitting additional food additives is a minor, deregulatory change and their use is voluntary. This standing exemption relates to the introduction of a food to the food supply that has been determined to be safe.

FSANZ however, has given consideration to the costs and benefits that may arise from the proposed measure for the purposes of meeting FSANZ Act considerations. The FSANZ Act requires FSANZ to have regard to whether costs that would arise from the proposed measure outweigh the direct and indirect benefits to the community, government or industry that would arise from the proposed measure (S.29 (2)(a)).

The purpose of this consideration is to determine if the community, government, and industry as a whole is likely to benefit, on balance, from a move from the status quo. This analysis considers to either approve or reject the application (retain the status quo). FSANZ is of the view that no other realistic food regulatory measures exists, however information received may result in FSANZ arriving at a different outcome.

The consideration of the costs and benefits in this section is not intended to be an exhaustive, quantitative economic analysis of the proposed measures and, in fact, most of the effects that were considered cannot easily be assigned a dollar value. Rather, the assessment seeks to highlight the likely positives and negatives of moving away from the status quo by permitting the use of Reb M produced from fermentation as a food additive in certain foods.

Costs and benefits of permitting the use of Reb M produced by GM fermentation as an additive in certain foods

Consumers seeking products that have reduced sugar and/or energy content may benefit from the use of Reb M (produced by GM fermentation of *S. cerevisiae*) as a food additive in certain foods. The main benefits to consumers may include the choice of additional food products that become available due to the use of this Reb M by Australian and New Zealand manufacturers and access to products manufactured overseas.

In the USA, Amyris's Reb M has GRAS status for use as a table top sweetener and a general purpose non-nutritive sweetener in foods. Permission to use Amyris's Reb M as a food additive, will enable Australian and New Zealand food manufacturers to potentially access and use a product assessed as safe that is available to their overseas competitors. This may improve their capacity to compete in overseas markets. Use by industry is voluntary, therefore it will only be used where industry believe a net benefit exists for them above using existing intense sweeteners.

The Applicant is not requesting an extension for the use of steviol glycosides to additional food products, nor is it requesting an increase to the permitted quantities of steviol glycosides in permitted food products. For this reason there are unlikely to be any additional costs for governments.

FSANZ has assessed that the direct and indirect benefits that would arise from permitting the use of Amyris's Reb M as a food additive will most likely outweigh the costs arising from that permission being granted.

2.4.1.2 Other measures

FSANZ considers that there are no other measures (whether available to FSANZ or not) that would be more cost-effective than a food regulatory measure developed or varied as a result of the application.

2.4.1.3 Any relevant New Zealand standards

The Standards and Schedules relevant to the draft variation apply in both Australia and New Zealand. There are no relevant New Zealand only Standards.

2.4.1.4 Any other relevant matters

Other relevant matters are considered below.

2.4.2 **Subsection 18(1)**

FSANZ has also considered the three objectives in subsection 18(1) of the FSANZ Act during the assessment.

2.4.2.1 Protection of public health and safety

No potential public health and safety concerns associated with Amyris's Reb M were identified. For more detail, see SD1.

2.4.2.2 The provision of adequate information relating to food to enable consumers to make informed choices

The labelling requirements for the provision of information to consumers are discussed in section 2.2.1 above.

2.4.2.3 The prevention of misleading or deceptive conduct

As explained above, Amyris's Reb M is not obtained from the stevia plant. FSANZ notes that steviol glycosides are sometimes marketed as stevia, a natural sweetener obtained from the leaves of the stevia plant, sometimes accompanied by leaf graphics. Any such marketing as well as claims such as 'natural' would be subject to consumer protection laws, fair trading laws and food laws in Australia and New Zealand that require that marketing and labels do not misinform consumers through false, misleading or deceptive representations.

2.4.3 Subsection 18(2) considerations

FSANZ has also had regard to:

the need for standards to be based on risk analysis using the best available scientific evidence

FSANZ used the best available scientific evidence to conduct the risk assessment which is provided in SD1. The applicant submitted a dossier of scientific studies as part of its application. FSANZ also had regard to other technical information including scientific literature in assessing the application.

the promotion of consistency between domestic and international food standards

The specifications of Amyris's Reb M meet those established by the Joint FAO/WHO Expert Committee on Food Additives (JECFA 2017), the Food Chemicals Codex (FCC 2018) and

the European Commission specifications for steviol glycosides (EC 2016).

• the desirability of an efficient and internationally competitive food industry

Permission to use Amyris's Reb M as a food additive will enable Australian and New Zealand food manufacturers to access and use a product assessed as safe that is available to some overseas competitors. This will improve their capacity to compete in overseas markets. See discussion at section 2.4.1 above.

the promotion of fair trading in food

FSANZ's assessment based on the best available scientific evidence is that Amyris's Reb M is safe for use as a food additive. It is permitted for use elsewhere. It is therefore appropriate that Australian and New Zealand food industries can also benefit by gaining permission to use Amyris's Reb M.

• any written policy guidelines formulated by the Forum on Food Regulation

The Policy Guideline 'Addition to Food of Substances other than Vitamins and Minerals' includes specific order policy principles for substances added to achieve a solely technological function, such as food additives. These specific order policy principles state that permission should be granted where:

- the purpose for adding the substance can be articulated clearly by the manufacturer as achieving a solely technological function (i.e. the 'stated purpose')
- the addition of the substance to food is safe for human consumption
- the amounts added are consistent with achieving the technological function
- the substance is added in a quantity and a form which is consistent with delivering the stated purpose
- no nutrition, health or related claims are to be made in regard to the substance.

FSANZ has determined that permitting Amyris's Reb M from fermentation, is consistent with these specific order policy principles.

3 Draft variation

The draft variation to the Code is at Attachment A and is intended to take effect on gazettal.

A draft explanatory statement is at Attachment B. An explanatory statement is required to accompany an instrument if it is lodged on the Federal Register of Legislation.

- A. Draft variation to the Australia New Zealand Food Standards Code
- B. Draft Explanatory Statement

Food Standards (Application A1207 - Rebaudioside M as Steviol Glycoside) Variation

The Board of Food Standards Australia New Zealand gives notice of the making of this variation under section 92 of the *Food Standards Australia New Zealand Act 1991*. The variation commences on the date specified in clause 3 of this variation.

Dated [To be completed by the Delegate]

[Insert name and title of Delegate]

Delegate of the Board of Food Standards Australia New Zealand

Note:

This variation will be published in the Commonwealth of Australia Gazette No. FSC XX on XX Month 20XX. This means that this date is the gazettal date for the purposes of clause 3 of the variation.

Attachment A – Draft variation to the Australia New Zealand Food Standards Code

1 Name

This instrument is the Food Standards (Application A1207 – Rebaudioside M as Steviol Glycoside) Variation.

2 Variation to a standard in the Australia New Zealand Food Standards Code

The Schedule varies a Standard in the Australia New Zealand Food Standards Code.

3 Commencement

The variation commences on the date of gazettal.

Schedule

[1] Schedule 3 is varied by inserting in the table to subsection S3—39(2) in alphabetical order

Rebaudioside M

Saccharomyces cerevisiae strain Y63348 containing novel genes for the production of rebaudiosides

Attachment B – Draft Explanatory Statement

1. Authority

Section 13 of the *Food Standards Australia New Zealand Act 1991* (the FSANZ Act) provides that the functions of Food Standards Australia New Zealand (the Authority) include the development of standards and variations of standards for inclusion in the Australia New Zealand Food Standards Code (the Code).

Division 1 of Part 3 of the FSANZ Act specifies that the Authority may accept applications for the development or variation of food regulatory measures, including standards. This Division also stipulates the procedure for considering an application for the development or variation of food regulatory measures.

The Authority accepted application A1207 which sought an amendment to the Code to permit the use of rebaudioside M (Reb M) produced from fermentation by a genetically modified *Saccharomyces cerevisiae* (*S. cerevisiae*) strain, as a food additive intense sweetener.

The Authority considered the application in accordance with Division 1 of Part 3 of the FSANZ Act and has prepared a draft variation.

2. Purpose

The Authority has prepared a draft variation to insert a new entry into the table to subsection S3—39(2) of the Code to permit Reb M produced from fermentation by a particular GM *S. cerevisiae* strain to be used as a food additive as an intense sweetener, in accordance with the Code's existing permissions and limits for steviol glycosides (including for steviol glycosides containing Reb M).

3. Documents incorporated by reference

The variations to food regulatory measures do not incorporate any documents by reference.

4. Consultation

In accordance with the procedure in Division 1 of Part 3 of the FSANZ Act, the Authority's consideration of application A1207 will include one round of public consultation following an assessment and the preparation of a draft Standard and associated assessment summary. A call for submissions (including the draft variation) will occur for a six-week consultation period.

The Office of Best Practice Regulation (OBPR) granted the Authority a standing exemption from needing to develop a Regulatory Impact Statement for proposed variations of the Code to permit food additives (OBPR correspondence dated 24 November 2010 - reference 12065). This standing exemption was provided as permitting additional food additives (including new methods of manufacture of existing food additives) is likely to have only a minor impact on business and individuals. It is a minor, deregulatory change that allows for the introduction of a new version of a food additive to the food supply that has been determined to be safe. The use of the approved food additive is also voluntary.

5. Statement of compatibility with human rights

This instrument is exempt from the requirements for a statement of compatibility with human rights as it is a non-disallowable instrument under section 94 of the FSANZ Act.

6. Variation

Item 1 inserts a new entry into the table to subsection S3—39(2), which lists 'prescribed steviol glycosides' for the purposes of specifications in subsection S3—39(3).

The new entry is 'Rebaudioside M' derived from 'Saccharomyces cerevisiae strain Y63348 containing novel genes for the production of rebaudiosides'. In other words, Reb M derived from this source will be a prescribed steviol glycoside and specifications in subsection S3—39(3) will apply to this Reb M.

The effect of this amendment will be to permit Reb M that is derived from this source, obtained by fermentation, and not from the leaves of the *Stevia rebaudiana* Bertoni plant, to be used as a food additive in accordance with the existing food additive permissions in the Code for steviol glycosides, provided that the Reb M complies with the specifications listed in subsection S3—39(3).
