Similarity Assessment of 2mEPSPS Protein to Known Toxins by Bioinformatics Analysis
(Update, March, 2011)

SUMMARY

The *2mEPSPS* is a double mutated 5-enolpyruvylshikimate-3-phosphate synthase gene originally derived from maize (*Zea mays* L.). The EPSPS encoded by *2mEPSPS* gene provides tolerance to glyphosate-based herbicides. In this study, the amino acid sequence of the 2mEPSPS protein was evaluated for sequence similarity to known protein toxins using a BLASTp search against an up-to-date GenBank non-redundant protein sequences (nr) database (updated to March 29, 2011). The majority of the sequence alignments returned by the search were related to various EPSPS enzymes. The remaining alignments were related to unknown hypothetical proteins. The BLASTp search results indicated that the 2mEPSPS protein contains no meaningful sequence similarities with any known proteins that may present toxicity to humans or animals.

Similarity Assessment of 2mEPSPS Protein to Known Toxins by Bioinformatics Analysis
(Update, March, 2011)

ABSTRACT

The *2mEPSPS* is a double mutated 5-enolpyruvylshikimate-3-phosphate synthase gene originally derived from maize (*Zea mays* L.). The EPSPS encoded by *2mEPSPS* gene provides tolerance to glyphosate-based herbicides. In this study, the amino acid sequence of the 2mEPSPS protein was evaluated for sequence similarity to known protein toxins using a BLASTp search against an up-to-date GenBank non-redundant protein sequences (nr) database (updated to March 29, 2011). The majority of the sequence alignments returned by the search were related to various EPSPS enzymes. The remaining alignments were related to unknown hypothetical proteins. The BLASTp search results indicated that the 2mEPSPS protein contains no meaningful sequence similarities with any known proteins that may present toxicity to humans or animals.

INTRODUCTION

The *2mEPSPS* is a double mutated 5-enolpyruvylshikimate-3-phosphate synthase gene originally derived from maize (*Zea mays* L.). The EPSPS encoded by *2mEPSPS* gene provides tolerance to glyphosate-based herbicides. The safety assessment of proteins expressed in transgenic plants may include an evaluation of whether or not the protein can function as a potential toxin when present in the human diet. It has been reported that assessing the potential toxicity of a protein may include comparison of the protein sequence to known protein toxin sequences (Codex Alimentarius, 2003) since there are no commonly recognized definition of a protein as a toxin based on their sequences, protein sequence comparison should be made against all available proteins as a conservative approach. Proteins identified with statistically significant similarity using a local alignment algorithm should then be evaluated for their relevance as potential toxins. For small-scale analyses, such as a single search of a query protein against a large database, a statistically significant similarity that ensures avoidance of false positives (labeling a sequence as related to something in the database when it is not) typically employs an expectation value (E-value) between 0.001 and 0.01. The E-value corresponds to the number of times one would expect to see a match of equal or greater quality by chance (false positive) in a search of the database. For E-values of 0.001 or 0.01, one would expect to find a false positive result once in 1000 or 100 searches, respectively (Pearson, 2000). For $E() = 1$, there is a statistically equal chance of a hit occurring due to homology or by random chance in a search of a given database. Although little can be done to avoid false negatives (labeling a sequence as unrelated to something in the database when in fact a homolog is present), visual inspection of the quality of less conservative alignments with $E() < 1$ may minimize false negative results (Pearson, 2000).

The objective of this study was to compare the amino acid sequence of the 2mEPSPS protein expressed in transgenic events with known protein toxins in the public GenBank non-redundant protein sequence (nr) database (Updated March 29, 2011).

METHODS

Query Sequence Preparation

The 2mEPSPS protein sequence was prepared in FASTA format for use with BLASTp search program (Appendix 1).

Toxicity Assessment

To assess potential toxicity of the 2mEPSPS protein, a search for similarity of protein sequences was conducted using the BLASTp program. Amino acid sequences of 2mEPSPS were queried using the BLASTp (Version 2.2.22+) against the GenBank non-redundant protein sequences (nr) database (updated to March 29, 2011), which incorporates non-redundant entries from all GenBank and RefSeq nucleotide translations (Genpept “nr”) along with protein sequences from SWISS-PROT (<http://www.expasy.org/sprot/>), PIR (<http://pir.georgetown.edu/>), PRF (<http://www.prf.or.jp/aboutdb-e.html>), and PDB (<http://www.wwpdb.org/>). The search was performed using an internal UNIX computer with default settings (Matrix = BLOSUM62, Gap Costs = Existence: 11, Extension: 1, Words =3) except that a cutoff expectation was set to 1, the low complexity filtering was turned off, and the sequence output was set to 5000 alignments. Although a statistically significant sequence similarity generally requires a match with an expectation value less than 0.01, a cutoff of $E() < 1.0$ ensures that proteins with even limited similarity will not be overlooked in the search (Pearson, 2000).

RESULTS AND DISCUSSION

The search of the 2mEPSPS protein sequence against GenBank non-redundant protein sequences returned a total of 3491 hits with 2565 hits with $E() < 0.01$ (Appendix 2). Among the 2565 alignments, 2364 hits were related to the shikimate pathway associated herbicide-tolerant proteins from various plant and bacterial species, and 164 were related to unknown proteins or

hypothetical proteins (Table 1). Among the 2364 shikimate pathway associated herbicide-tolerant proteins, 1864 proteins were related to 3-phosphoshikimate 1-carboxyvinyltransferase enzyme, 141 were related to 5-enolpyruvyl shikimate 3-phosphate synthase (EPSPS) enzyme, 348 proteins were related to UDP-N-acetylglucosamine 1-carboxyvinyltransferase enzyme, and 11 proteins were related to dehydroquinate synthase. The rest of the alignments were not significant, and none of them were associated with known toxins.

CONCLUSION

Bioinformatics analysis of the 2mEPSPS protein using BLASTp search against an up-to-date GenBank non-redundant protein (nr) database did not generate any significant sequence similarity with any known proteins that are harmful to humans or animals.
