**Subject:** Submission re. Consultation paper on Food derived using 'new breeding techniques'

Dear FSANZ,

The definition of food produced using gene technology needs to encompass the new breeding techniques, such as techniques that involve deleting or editing a piece of DNA. These new breeding techniques are forms of genetic modification, and, as such, need to be subject to GMO regulations and GMO labelling. There is not sufficient evidence that these breeding techniques carry no risks to human health, and, like all GMOs, I am concerned about unforeseen genomic interactions and unpredictable effects.

Yours sincerely, Zoe

All genetic modification techniques should be treated with a precautionary approach and be carefully assessed by independent bodies for both short and long term risks to health, the ecology and the environment, before being approved. Both Austria and Norway have followed this path, concluding that there is simply not enough known about the risks of these techniques to have the confidence to release them into their foodchains without a rigorous case by case assessment.

Additionally, any products that have been genetically modified, regardless of the technique involved, need to be labelled to allow the consumer to make a conscious choice on whether to purchase them or not.

Yours sincerely, Liz Kloosterman

To FSANZ,

We ask for the precautionary principle to be exercised.

Shoppers have a right to know what they're eating and CRISPR should not be allowed to escape the (albeit flimsy) rules applied to other forms of genetic engineering.

Gene editing techniques cause DNA double strand breaks and can be used sequentially to make dramatic differences to DNA.

They are also prone to additional unexpected mutations. The risks associated with these techniques warrant pre-market safety assessment and approval.

RNA interference is a GM technique and can result in heritable genetic changes so must also be assessed for safety before being used in our food.

Yours sincerely, Vivienne Reiner

**From:** Sheridan Adams <campaigns@good.do>  
**Sent:** Saturday, 7 April 2018 5:18 PM  
**To:** NBT Consult Submissions; Joel Fitzgibbon; David Littleproud; Tony Zappia; Bridget McKenzie; Niall Blair; Jill Hennessy; Steven Miles; Alannah MacTiernan; Meegan Fitzharris  
**Subject:** Submission re. Consultation paper on Food derived using 'new breeding techniques'

Food Standards Australia New Zealand (FSANZ)

I demand all GM food be assessed for safety and I want to know the results of these assessments. I want to know what me and my family are eating, and I want to make my own choices of the food we eat.

To deregulate a range of new genetic modification (GM) techniques in animals, plants and microbes is not the way to proceed. Genetically modified foods won't be assessed for safety either .. so the public will not know what they are buying. Australia would be the first country in the world to deregulate these techniques .. this issue is too important to be so foolhardy. If you do deregulate it would mean foods will enter our food chain and our environment with no safety testing and no labelling. The risks are enormous and the results could be catastrophic.

Reviews commissioned by the Austrian and Norwegian governments concluded that not enough is known about the risks these new GM techniques pose. They recommended that products derived from them require comprehensive case-by-case risk assessments.

Please, do not bow to pressure from the biotechnology industry .. safety and transparency first.

Yours sincerely, Sheridan Adams Mount Barker, South Australia, 5251, Australia

**Subject:** Submission re. Consultation paper on Food derived using 'new breeding techniques'

I do not support any deregulation of genetic modification techniques. “New breeding techniques” are still artificial genetic modification, and should not be deregulated. In my opinion these techniques should not be allowed at all, since there is a risk of permanent genetic pollution.

Any GM products or “NBT” products should be labelled as GM so that consumers are fully informed, and can choose to avoid purchasing these products. This includes gene editing, GM rootstock grafting, cisgenesis, intragenesis RNA interference, null segregants, and CRISPR.

GM plants, animals and microbes all pose unique risks so assessing the GM production process is appropriate.

FSANZ has an abysmal track record so far in overseeing the safety of these novel so called foods , the product of genetic engineering . Where are the labs doing independent safety testing? Where are the ethics committees? Could it ever be a good idea to allow these untested gm creations into our food chain without labels or anyway to trace the devastation to human health caused? Don't tell me gm has caused not so much as a sniffle when hospitals and schools are full of chronically ill people and cancer will now affect 1 in 2 men.

**Subject:** Submission re. Consultation paper on Food derived using 'new breeding techniques'

I am aware there is controversy about the known and unknown effects of the use of gm technology in plant and other foods for both animals, humans and the environment, especially in the longer term. In the medical sphere, new products are required to under go rigorous and prolonged testing to prove their safety and improved effectiveness for human use and identify adverse side effects.

I contend that the use of gm processes in food places those food products in a similar position to new pharmaceutical products and should be subjected to similar scientific scrutiny to ensure their relative safety for humans, animals and the environment.

Establishment of an expert independent committee, fairly balanced between research science, industry and consumer groups to identify and institute appropriate criteria and processes to adequately examine all new techniques and products, should go a long way to appease interested parties and any apprehension in the general community.

While some other countries' expert panels are not convinced enough is known about the risks new GM techniques pose, and are recommending that products derived from them require comprehensive case-by-case risk assessments, community resistance in Australia will persist.

**Subject:** Submission re. Consultation paper on Food derived using 'new breeding techniques'

Please protect us from unknown dangers and risks from gene technology in connection with our food.  
Please at least, make sure our food is labelled either GM or non-GM

Yours sincerely, Dell Taranto Epping, New South Wales, 2121, Australia

**Subject:** Submission re. Consultation paper on Food derived using 'new breeding techniques'

I urge the he Australian Government to Have mandatory labelling for all GM foods and to test all GM foods for safety. Consumers deserve to know what they are eating and to have the choice of whether to purchase GM food or not. Thank you.

Yours sincerely, Kelli Lavelle Geelong, Victoria, 3220, Australia

Gene editing techniques cause DNA double strand breaks and can be used sequentially to make dramatic differences to DNA. They are also prone to additional unexpected mutations. The risks associated with these techniques warrant pre-market safety assessment and approval.

Yours sincerely, Sena Goztepeli Mount Waverley, Victoria, 3149, Australia
