Subject: Reduced Lignin Line KK179 Lucerne

Submission against allowing Lucerne KK179 into the country.

. You know that any first evidence that there is no harm has been proven wrong time and time again because the companies that want to patent it and make money from it falsify their tests and blatantly lie . They get universities to do tests that are paid money by the company. It is full of fraud.

Genetically altered plants are different and changing one gene alters other genes which are not known about.

It will contaminate other varieties of Lucerne grown close by.

It seems what they are trying to patent is more for profit than being of any use to farmers.

From past evidence no amount of submissions make any difference to your decision on any GE products. You do not make use of any independent research and this is only don too late when the damage is done. No GE products out of the lab are needed and they will not add to feeding the world one little bit.
