### **Re: Submission on Application A1115: irradiation of Blueberries and Raspberries**

I strongly object to the irradiation of blueberries and raspberries. There is absolutely no need to irradiate foods grown in Australia for domestic consumption. There are as yet unknown risks involved in doing this.

Blueberries and raspberries, in particular, are nutritious foods, providing vitamins and anti-oxidants. Irradiating them compromises their value to us as foods. The move to remove labeling makes the process doubly problematic for those of us who want organically grown, fresh fruit and want to know how our food has been treated so that we can make informed choices as buyers and consumers.

Just because something can be done and someone wants to profit from doing it, does not make it good, or useful for the Australian public.
