To whom it concerns,

Polling shows most Australians, and global citizens don't want to eat genetically modified (GM) foods. All GM foods should be independently assessed for their health and environmental hazards and risks, be labelled as GM, and be traceable. This will allow farmers, food producers, retailers, and shoppers to avoid them, for many important reasons.

I am a person who has had cancer and as such I need and want to be very careful about what food products I eat. I am not prepared to eat products that come onto the market and have not been adequately tested regarding their safety and propensity to increase the risk of cancer in the people who eat them. As such I am not prepared to eat genetically modified products. As a person who has had cancer I have an absolute right to know what I am eating and be able to choose what I do not eat. I also have significant concerns about what babies and children eat given their vulnerability to products such as these. Thus I have the following concerns and am vehemently opposed to the changes. There are many companies that have proven they cannot be trusted in what they do to the food chain. I significantly support the following information and concerns.

I strongly oppose changes to the Food Code that would allow a wide range of GM foods, made using novel methods that have scant history of safe use, to be sold without safety assessment or labelling. These would include meat and milk from some genetically modified animals. This would be totally unacceptable for babies and young children let alone anyone who has cancer. There are similar concerns re substances like vanilla and stevia produced by genetically modified microbes in factory vats. These changes would undermine FSANZ's key responsibilities to ensure food safety and our right to know what is in our food.

Agrochemical companies cannot be trusted to self-assess the safety of GM foods as they have an appalling record of manipulating data to promote dangerous products.

Gene editing techniques have been found to make genetic changes that could never occur in nature and to result in widespread genetic damage that often goes undetected by GM developers.

I am deeply concerned that FSANZ has relied on advice from scientists with serious conflicts of interest, to conclude these new GM foods pose no greater risks than existing foods. Those seeking to commercialise GM plants, animals and microbes should play no role in deciding how - or even whether - foods derived from them should be regulated.

The proposed changes would make Australia one of very few countries in the world to allow genetically modified animal products into our food chain with no regulation or labelling. This would put us at odds with our international trading partners, which FSANZ admits "may have a significant impact on trade". The Cartagena Protocol on Biosafety, an international agreement signed by 166 governments worldwide, and the UN's food standards body Codex Alimentarius agree that all GM techniques differ from conventional breeding and that pre-market safety assessments are essential before GM organisms are used in food.

I support expanding the definition for 'gene technology' so FSANZ continues to assess and regulate all techniques and methods of genetic modification, other than conventional breeding. The proposal to deregulate new and emerging GM techniques and their food products, which pose new and unassessed risks, is completely unacceptable.

Thank you for taking my well-founded and significant concerns into consideration.
